## Pump selection

### F1 and T1

The following table shows pump flow at selected PTO gear ratios and engine rpm's.

PTO gear ratio	Engine speed [rpm]	Pump flow [l/min]						
		F1-25	F1-41	F1-51	F1-61	T1-81 F1-81	F1-101	T1 121
1:0.8	800	16	26	33	38	52	66	76
	900	18	29	37	43	59	74	85
	1000	20	33	41	48	65	82	95
	1100	23	36	45	52	72	91	104
	1200	25	39	49	57	78	99	114
1:1.0	800	20	33	41	48	65	82	95
	900	23	37	46	54	73	93	107
	1000	26	41	51	60	82	103	119
	1100	28	45	56	65	90	113	130
	1200	31	49	61	71	98	123	142
1.1.25	800	26	41	51	60	82	103	119
	900	29	46	57	67	92	116	133
	1000	32	51	64	74	102	129	148
	1100	35	56	70	82	111	141	163
	1200	38	61	77	89	122	154	178
1:1.5	800	31	49	61	71	98	123	142
	900	35	55	69	80	110	139	160
	1000	38	61	77	90	122	154	178
	1100	42	67	84	98	135	170	196
	1200	46	74	92	107	147	185	213

**NOTE:**

- Make sure max torque and bending moment (due to the weight of the pump) of the utilised PTO are not exceeded. (The approx. center of gravity of the various pump sizes are shown in the installation drawings).
- Make sure max allowed output torque from the PTO is not exceeded.
- Contact Parker Hannifin if the inlet (suction) pressure is believed to be less than 1.0 bar (absolute); insufficient inlet pressure can cause noise and pump damage because of cavitation.

**Flow and torque formulas** (no regard to efficiency)

$$\text{Flow: } Q = \frac{D \times n}{1000} \text{ [l/min]}$$

where: D is pump displacement [cm<sup>3</sup>/rev]  
n is shaft speed [rpm]

$$\text{Torque: } M = \frac{D \times p}{63} \text{ [Nm]}$$

where: D is pump displacement [cm<sup>3</sup>/rev]  
p is utilised pressure [bar]

A suitable pump size for a truck application can be selected as follows:

**Operating conditions**

As an example, a cargo crane specifies:

- Flow: 60-80 l/min
- Pressure: 230 bar
- Diesel engine speed  $\approx$  800 rpm

**Determine pump speed**

As example a PTO with a Gear Ratio of 1:1.54.

The pump speed will be:

- $800 \times 1.54 \approx 1200$  rpm

**Select a suitable pump size**

Use diagram 1 and select a pump that will provide 60 - 80 l/min at 1200 rpm.

Follow line 'a' (1200 rpm) until it crosses line 'b' (70 l/min).

- F1-61 is a suitable choice

**Required input torque**

Make sure the PTO and the gear-box tolerates the pump torque. Use diagram 2 to obtain the required pump torque.

Follow a line from 'c' (230 bar) until it crosses the F1-61 line (the selected pump).

- Read 220 Nm (at 'd')

**NOTE:** A rule-of-thumb is to select the highest PTO ratio and the smallest pump size that meets the crane specification without exceeding the pump speed, pressure, and power limitations.

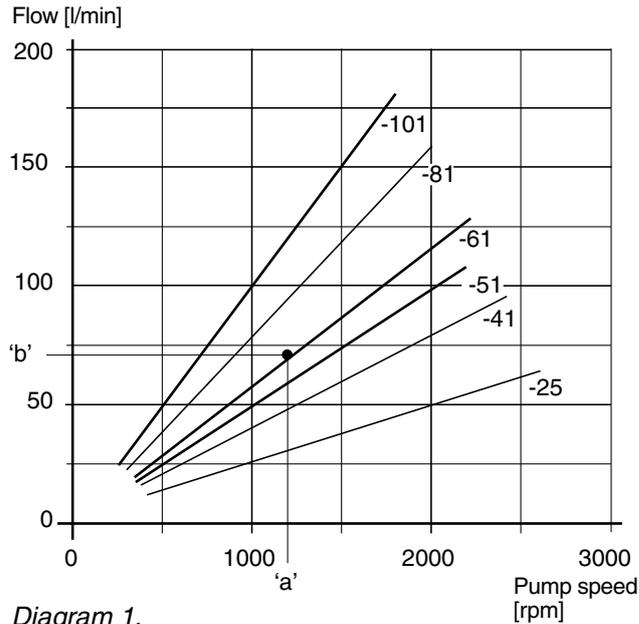

Diagram 1.

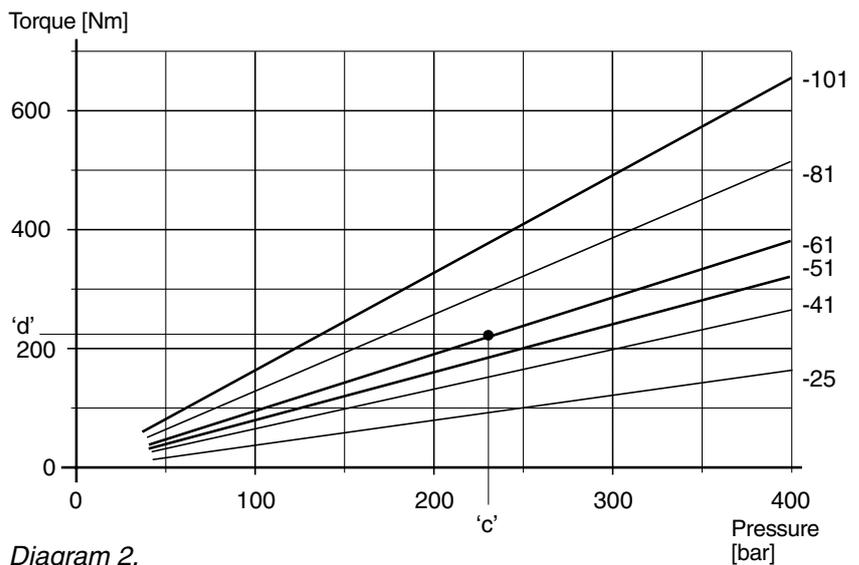

Diagram 2.

**Line selection  
 all pumps**

Line type	Flow velocity [m/s]
Inlet (suction)	max 1.0
Outlet (pressure)	max 5.0

Flow rate [l/min]	Flow velocity [m/s] at selected line sizes [mm/inches]							Inlet (suction) line
	19 / 3/4"	25 / 1"	32 / 1 1/4"	38 / 1 1/2"	51 / 2"	64 / 2 1/2"	75 / 3"	
25	1.5	0.8	0.5	0.4	0.2	0.1	0.1	
50	2.9	1.7	1.0	0.7	0.4	0.3	0.2	
75	4.4	2.5	1.6	1.1	0.6	0.4	0.3	
100	5.9	3.4	2.1	1.5	0.8	0.5	0.4	
150	8.8	5.1	3.1	2.2	1.3	0.8	0.5	
200	-	-	4.1	2.9	1.6	1.1	0.7	
250	-	-	5.3	3.7	2.1	1.3	0.9	

Table 1.

Outlet (pressure) line

In order to obtain sufficient inlet (suction) pressure to the pump, low noise level and low heat generation, flow speeds shown in table 2, right, should not be exceeded.

From table 1 (page 13), select the smallest line dimension that meets the flow speed recommendation; example:

- At 100 l/min, a 50 mm suction line and a 25 mm pressure line is needed.

**NOTE:** Long inlet (suction) lines, low inlet pressure (caused by e.g. a reservoir positioned below the pump) and/or low temperatures may require larger line dimensions.

Alternatively, the pump speed will have to be lowered to avoid pump cavitation (which may cause noise, deteriorating performance and pump damage).

Line type	Flow velocity [m/s]
Inlet (suction)	max 1.0
Outlet (pressure)	max 5.0

**Nomogram**

Flow - Line dimension - Flow velocity

Table 2.

Example 1  
Pressure line  
Q = 65 l/min  
d = 3/4"  
v = 3.8 m/s

Example 2  
Suction line  
Q = 50 l/min  
v = 0.8 m/s  
d = 1 1/2"

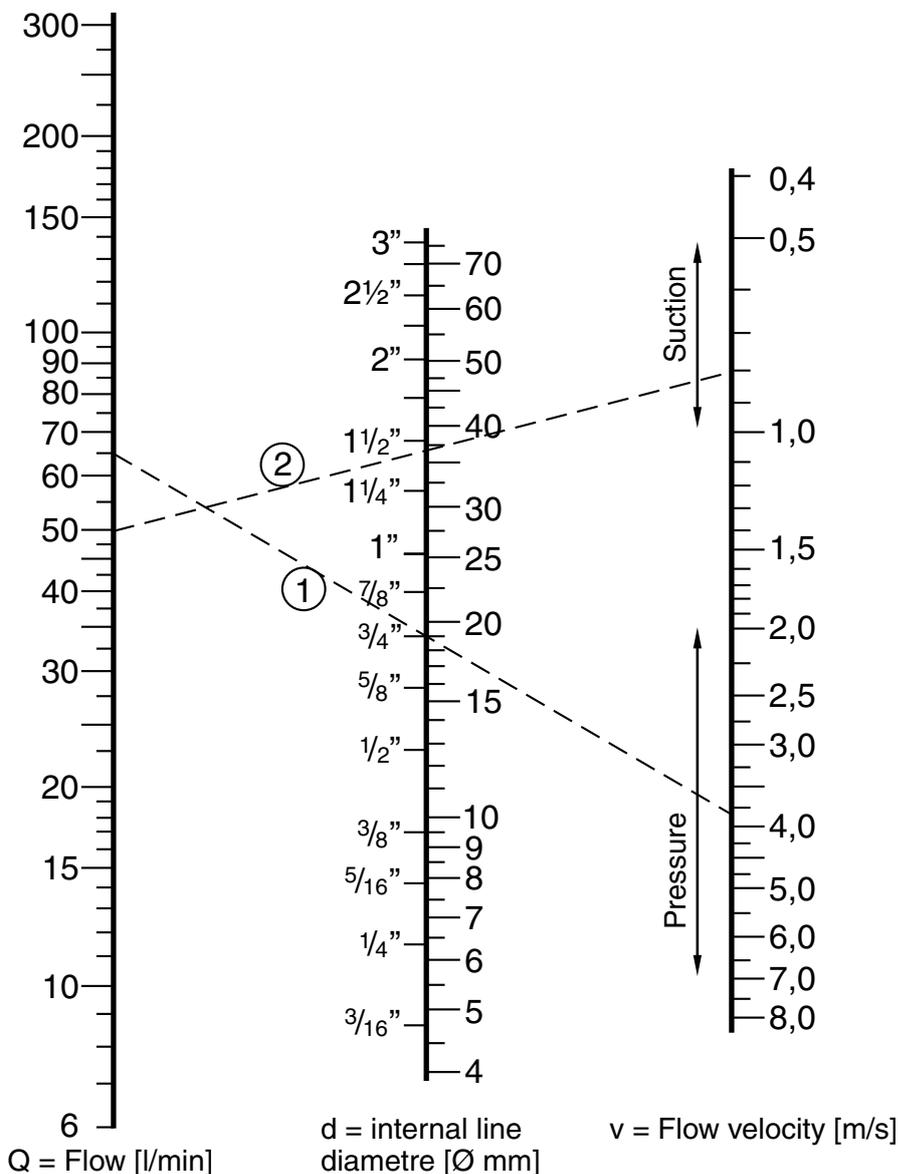

Table 3.

## F1 Pump ISO

Series F1 is a further development of our well known 'truck pump', the F1. The F1 offers many additional values for operators of cargo cranes, hook loaders, skip loaders, forest cranes, concrete mixers and similar truck applications.

Series F1 is a very efficient and straight forward pump design with unsurpassed reliability.

Its small envelope size gives a simple and inexpensive installation.

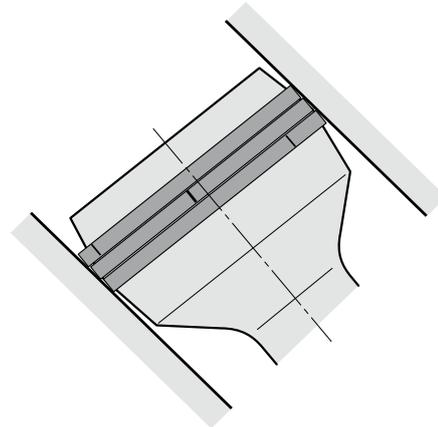

### Features of the F1 are:

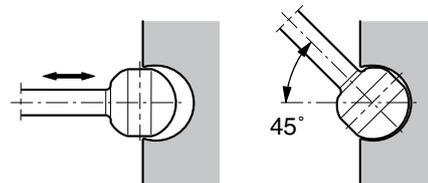

- High selfpriming speeds
- Operating pressures up to 400 bar
- High overall efficiency
- Low noise level
- Small installation dimensions
- Low weight

### ... thanks to:

- 45° bent-axis angle
- Optimal inlet port geometry in the end cap
- Single housing design
- Spherical pistons - high speeds
- Laminated piston rings - low leakage
- Positive synchronisation with timing gear
- Installation above the reservoir level possible
- Tolerates low temperatures and high temperature shocks
- Shaft end and mounting flange meet the ISO standard for all sizes

*F1 piston with laminated piston ring.*

*F1 piston-to-shaft locking.*

## F1-25 to -101, ISO Specifications

F1 frame size	25	41	51	61	81	101

General Information.....	20
F2 Twin-flow pump.....	20
Specifications .....	21
Installation Dimensions.....	22
Ordering code.....	22
Standard versions.....	22
Installation and start up .....	28

## F2 Twin-flow pump

Series F2 is a further development of the twin-flow version of series F1, the very first bent-axis truck pump on the market to feature two entirely independent flows.

With a suitable build-up of the hydraulic system, the main advantage with a twin-flow pump is that three different flows can be provided at the same engine speed.

The twin-flow pump makes it possible to further optimise the hydraulic system and offers:

- Less energy consumption
- Reduced risk of system overheating
- Lower weight
- Easier installation
- Standardised system solutions

The twin-flow pump makes it possible to operate two work functions that are independent of each other which leads to higher speed and an increased operating precision.

Another requirement can be a large and a small flow, or two equal flows. All of these alternatives are possible with the twin-flow pump.

The pump can be utilised to provide one flow at high system pressure, and, as soon as the pressure has decreased sufficiently, add the flow from the other circuit.

This eliminates the risk of exceeding the PTO power rating and, at the same time, provide an optimal driving function.

### Typical twin-flow applications

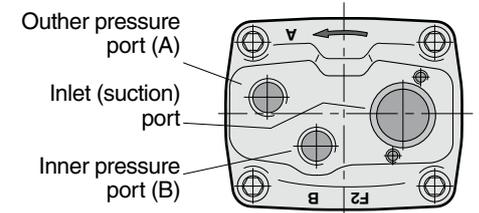

- Large truck loaders
- Forestry cranes
- Hook loaders/lift dumpers
- Tipper/crane combinations
- Refuse collecting vehicles

The pump shaft end/mounting flange meets the ISO standard and suits PTO direct mounting.

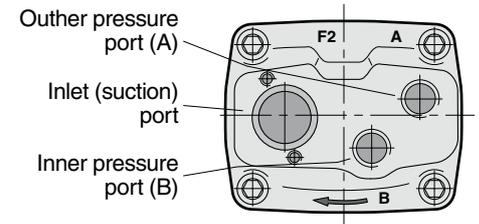

### Specifications

Frame size F2-	42/42	53/53	55/28	70/35	70/70
<b>Displacement [cm<sup>3</sup>/rev]</b>					
Port A	43	54	55	69	68
Port B	41	52	28	36	68
<b>Max operating pressure [bar]</b>					
continuous	350	350	350	350	300
intermittent	400	400	400	400	350
<b>Max shaft speed [rpm]</b> (unloaded pump; low pressure)	2550	2550	2550	2550	2550

## T1 Pump

The T1 fixed displacement pump is a further development of series T1, which was specifically designed to meet the requirements of light duty truck applications with short, non-frequent operating cycles such as tipper, and small loaders.

The design is very similar to that of the F1 series pumps but is even more compact. It utilises our well proven 45° concepts with spherical pistons and laminated piston rings, offering high volumetric and mechanical efficiencies and, thanks also to the small number of parts, unprecedented reliability.

- Shaft speed to 2300 rpm
- Operating pressure up to 350 bar
- High overall efficiency
- Low weight
- Small installation dimensions
- Robust construction

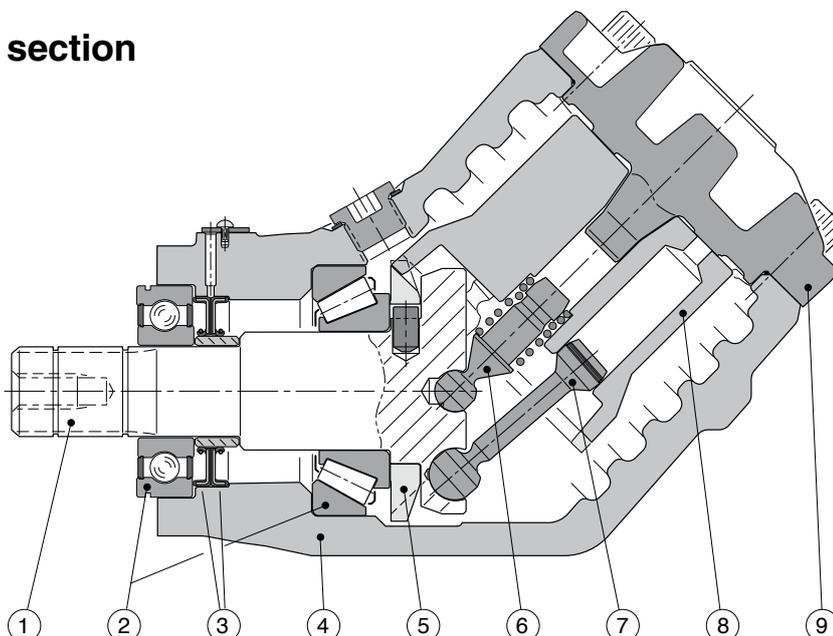

### Typical T1 applications

- Front end tippers
- Under body tippers
- Hydraulic system infrequently used and with short cycle times.

The T1, with shaft and mounting flange configuration conforming to the European standard, can be installed on most European truck gearboxes. Suitable power-take-offs are also available from Parker Hannifin.

(T1-81 shown)

1. Input shaft
2. Bearings
3. Shaft seals

4. Housing
5. Timing gear
6. Barrel support

7. Piston with piston ring
8. Cylinder barrel
9. End cap

## Specifications

T1 frame size	81	121	
<b>Displacement</b> [cm <sup>3</sup> /rev]	81.5	118.5	
<b>Max flow</b> <sup>1)</sup> [l/min]	163 <sup>3)</sup>	190 <sup>3)</sup>	
<b>Max operating pressure</b> [bar]			
	continuous	250	250
intermittent <sup>4)</sup>	350	350	
<b>Shaft speed</b> [rpm]			
	short circuited pump (low press.)	2300	2300
max speed <sup>2)</sup>	2000 <sup>3)</sup>	1600 <sup>3)</sup>	
<b>Torque</b> <sup>1)</sup> [Nm]			
	at 200 bar	258	376
	at 350 bar	453	658
<b>Input power</b> [kW]			
	continuous	54	71
intermittent <sup>4)</sup>	67	89	
<b>Weight</b> [kg]	8.5	12.5	

- 1) Theoretical values
- 2) Valid at an inlet pressure of 1.0 bar (abs.) when operating on mineral oil at a viscosity of 30 mm<sup>2</sup>/s (cSt).
- 3) Valid with 2 1/2" inlet (suction) line. With 2" suction line:  
 T1-81 – max 1400 rpm (Q≈120 l/min);  
 T1-121 – max 950 rpm (Q≈120 l/min).
- 4) Max 6 seconds in any one minute.

**NOTE:**  
 For noise level information, contact Parker Hannifin.

# Installation and start up

## Installing couplings, sleeves, and gears on the pump shaft.

This is a short installation and start up information.

To have the complete and latest installation information, always see the installation info supplied together with the pump.

### PTO installation

- 'Left hand' and 'Right hand' rotation defined in the illustrations on page 30.
- The driving gear of the PTO and the driven gear of the pump are shown in the illustration below. (A right hand rotating pump is shown).

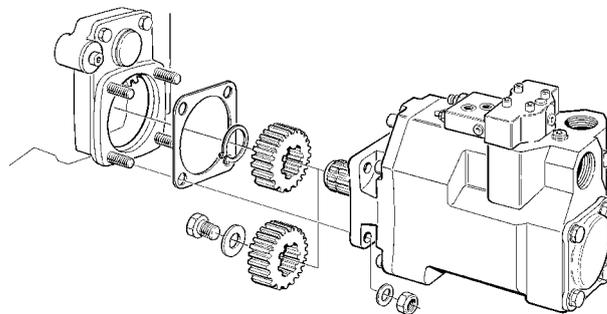

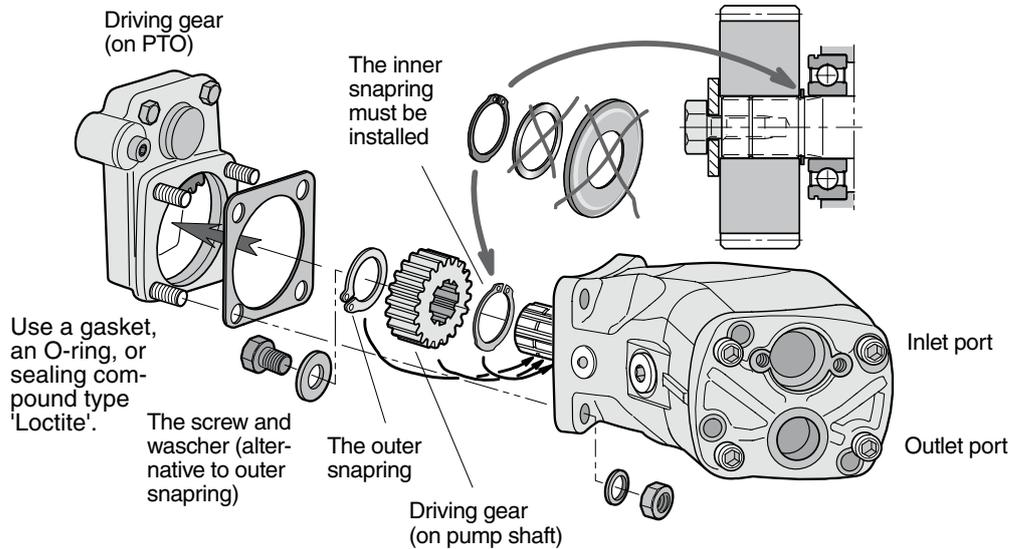

Fig. 6. VP1-to-PTO installation.

### IMPORTANT

Use some kind of special tool when you install couplings, sleeves, and gears on the pump shaft. Force must never be used when installing these parts on the F1 shaft.

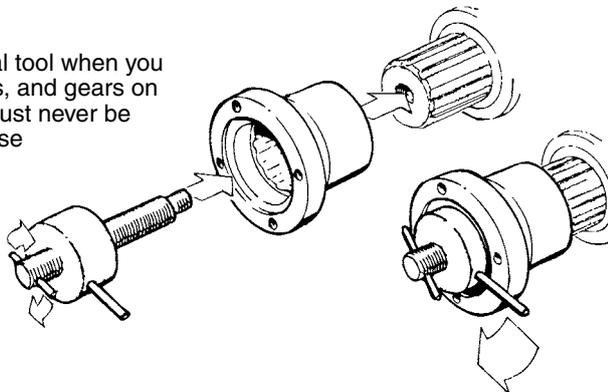

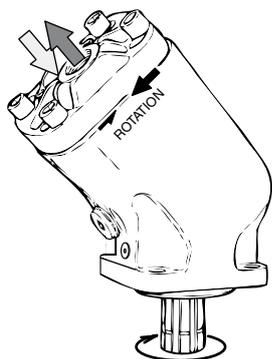

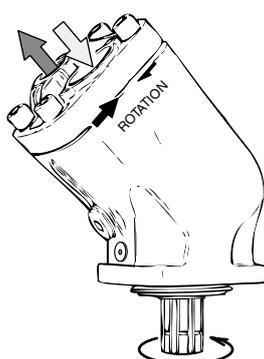

Fig. 7 Mounting tool.

**NOTE:** When considering installing an F1 on a splitter box, please refer to the installation information provided on pages 16-17, chapter 10-3.

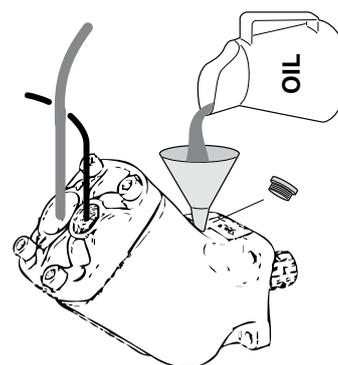

## Installation and start-up for F1, F2 and T1

Left hand (L.H.; counter clockwise) rotating pump.

Right hand (R.H.; clockwise) rotating pump.

Before start-up, the housing must be filled with hydraulic fluid.

### Direction of rotation

The pictures above show direction of flow vs. shaft rotation.

The direction of rotation can be changed (i. e. from right hand to left hand) by turning the end cap.

Remove the four cap screws and turn the end cap about half a turn while making sure it stays in contact with the barrel housing.

Re-fit the cap screws and torque to 80-100 Nm.

### Installation

Make sure max torque and bending moment (due to the weight of the pump) of the utilised PTO are not exceeded. (The approx. center of gravity of the various pump sizes are shown in the installation drawings).

The top illustration on page 28 shows two ways of installing a gear on the shaft of fixed displacement pumps. The pump shaft spline end usually fits directly in the PTO internal spline coupling.

**NOTE:** In order to obtain the longest bearing life, the pump should be installed according to the information shown on page 30 "Pump bearing life".

### Fluid viscosity

Recommended viscosity:  
 20 to 30 mm<sup>2</sup>/s (cSt).

Operating viscosity limits:

- Min 10 mm<sup>2</sup>/s; max 400 mm<sup>2</sup>/s.
- At start-up, max 4000 mm<sup>2</sup>/s.

### Fluids

The fixed displacement pumps data shown in the specifications for each pump are valid when operating on high quality, mineral based hydraulic oil.

Type HLP (according to DIN 51524) hydraulic oil is suitable as well as biologically degradable fluids like natural and synthetic esters and polyalphaolefins.

The utilised hydraulic fluid shall meet one of the following Swedish standards:

- SS 15 54 34
- SMR Hydraulic Oil Standard 1996-2.

Contact Parker Hannifin for further information.

**NOTE:** - ATF (automatic transmission fluid) and API type CD engine oils may also be useable.  
 - Seals are made of nitrile rubber; make sure the utilised fluid is compatible with this material.

### Fluid temperature

Main circuit: Max 75 °C.

**NOTE:** When considering installing an fixed displacement pump on a splitter box, please refer to the installation information provided on pages 16 and 17, chapter 10-3.

### Drain line

Fixed displacement pumps don't need an external drain line as they are internally drained.

When the pump is mounted in a Engine-PTO we recommend a drain line from the bypassvalve directly to oiltank.

### Filtration

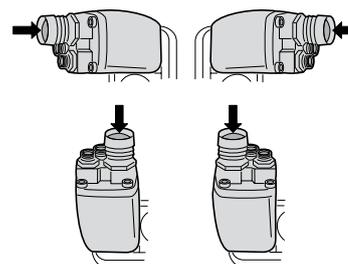

Filtration should follow ISO standard 4406: 1987, code 18/13.

To obtain the longest life of fixed displacement pumps, we recommend an oil cleanliness of 10 µm (absolute).

### Start-up

Make sure the entire hydraulic system is clean before filling it with a recommended hydraulic fluid. In particular, make sure the pump is filled (to at least 50%) as the internal leakage does not provide sufficient lubrication at start-up.

**NOTE:** - The suction port should always be above the pressure port when the pump is installed above the reservoir oil level.  
 - During operation, the pump must be filled with oil to at least 50%.

**If any oil should drop out of the indication-hole on the pump;**

- Stop the system immediately.
- Determine the cause of leakage.
- Replace damaged parts.
- Make sure you have corrected the source of the problem, not only the symptom.

Parker can not be held responsible for damage to PTO, engine and gearbox caused by improper maintenance of the hydraulic system.

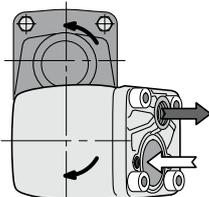

**Pump bearing life**

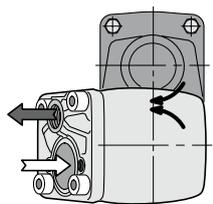

Bearing life is dependent on how the pump is installed on the PTO as shown in the illustrations below.

A pump mounted according to fig. 1 gives the lowest bearing life; the highest is obtained when installed according to fig. 3.

Parker Hannifin will assist in determining bearing life in a particular application.
